PROFESSIONAL SUMMARY

Principal DevSecOps Architect with 10+ years building secure, compliant cloud platforms for federal environments (FISMA, FedRAMP, NIST 800-53). Own strategy for 15+ AWS applications (\$4.3M over 5 years, 20K peak users), led the migration of 350 on-prem servers to AWS, and contributed to a \$3M FAA contract win. AWS Certified Solutions Architect – Professional.

LEADERSHIP & WORK EXPERIENCE

CSSI LLC | Washington, D.C.

Principal DevSecOps Architect

Aug 2024 – Present

- Own DevSecOps and cloud strategy for 15+ regulated production applications serving 20K users at peak; oversee a \$4.3M AWS portfolio over 5 years and lead 8 engineers across DevOps, cloud, security, and application engineering.
- Cut annual AWS spend for the top 4 applications from \$570K to \$463K (~19%) by decommissioning redundant environments after the on-prem-to-AWS migration; now applying rightsizing and reserved capacity to fine-tune costs further.
- Contributed to the technical roadmap and solution design behind a winning \$3M FAA airspace modernization proposal.
- Champion monitoring as code: standardized CloudWatch monitoring templates across all applications and moved infrastructure provisioning from CloudFormation to Terraform.
- Partner with GRC, SOC, Audit, Product, and Executive leadership to turn FISMA, FedRAMP, and NIST 800-53 requirements into policy-as-code and CI/CD guardrails, cutting manual reporting from 3–5 hours to 30 minutes per employee each sprint.
- Serve on the AI Governance Committee, defining AI guardrails, acceptable-use standards, and approved tools and policies under client contracts, plus a roadmap for future AI adoption.
- Standardize DevSecOps practices and share knowledge through internal presentations and blogs on cloud migration lessons learned and AI adoption.

Senior Engineering Manager

Feb 2022 – Jul 2024

- Led the 1.5-year migration of 10+ on-prem applications (350 servers) to AWS, from proposal and approval through pilot and cutover, defining architecture, security controls, and compliance requirements.
- Chose Elastic Beanstalk over Fargate to optimize hosting cost, and kept one application on a hybrid architecture instead of full migration to meet data security and contract requirements.
- Managed sprints for an 8-person cross-functional team, sustaining a 90% sprint success rate by removing roadblocks and shielding the team from distractions.
- Handled hiring and performance reviews and mentored engineers, sustaining delivery with a leaner team.
- Defined cloud security architecture (encryption, IAM, audit logging, segmentation) across 4 AWS and 2 Azure accounts; built a secure-by-default GitHub Actions CI/CD platform with policy-as-code controls that auto-generate audit evidence.
- Architected secrets management and key rotation with HashiCorp Vault; integrated Splunk, Tanium, CyberArk, Nessus, WebInspect, and DbProtect for unified monitoring, access control, and vulnerability management.
- Established vulnerability remediation SLAs for FISMA Moderate applications, cutting critical-finding remediation from 30 days to under 15.

Senior DevOps Engineer

Feb 2020 – Feb 2022

- Embedded automated security scanning into CI/CD pipelines for 8 applications, cutting production vulnerabilities ~80% and release cycles from 1 month to 2 weeks.
- Cut the monthly patch cycle from 48 hours to under 6 with zero application downtime.
- Tech lead for upgrading 412 of 553 servers (75%) from Windows Server 2019 and earlier to 2022 and from RHEL 8 to 9, owning configuration and testing.
- Set standards for secure coding, branching, design reviews, and release governance, reducing deployment issues ~40%; authored runbooks and incident response procedures.
- Automated failover, cutting it from 3 hours to under 15 minutes, within a disaster recovery design meeting contractual targets (RTO 3 hours, RPO 5 hours); standardized backup and retention policies.
- Streamlined the legacy data archival process, freeing up ~40% of storage and reducing manual effort by over 88%.

- Platform engineer on a 16-person team running CI/CD, infrastructure automation, and quality engineering for an in-house CMS serving 100+ publications and millions of daily readers.
- Built 8+ Jenkins CI/CD pipelines and automated environment provisioning with Terraform and Docker, cutting provisioning time from 20 minutes to under 8.
- Co-architected a model-based regression framework running ~1,000 nightly tests beyond CI/CD unit and integration tests, catching bugs pre-release, freeing manual testers for edge cases, and removing QA bottlenecks.
- Designed AppliTools visual regression and Sauce Labs cross-browser suites for all publication properties; owned Sumo Logic and New Relic monitoring dashboards and onboarded interns.

EARLIER EXPERIENCE

Data Migration Engineer — International Food Policy Research Institute, Washington D.C. (Nov 2016 – Jan 2017)

DevOps Engineer — REAN Cloud (AWS Partner), Herndon, VA (Apr 2016 – Sep 2016): AWS migrations, infrastructure automation, encryption, and deployment standardization.

KEY SKILLS

Cloud & Platform: AWS, Azure, VMware, Terraform, CloudFormation, Ansible, Docker, Kubernetes

DevSecOps & CI/CD: GitHub Actions, Azure Pipelines, Jenkins, Secure SDLC

Security & Compliance: NIST 800-53, FISMA, FedRAMP, HashiCorp Vault, IAM, SIEM (Splunk), CyberArk, Tanium, Nessus, Invicti, SonarQube, DbProtect, Prisma Cloud Scans

Data & Observability: Kafka, Splunk, Elasticsearch, Sumo Logic, New Relic, CloudWatch

CERTIFICATIONS

- AWS Certified Solutions Architect – Professional
- AWS Certified AI Practitioner
- Microsoft Certified: DevOps Engineer Expert (AZ-400)

EDUCATION

State University of New York, New Paltz

Master of Science in Computer Science

2014 – 2015
